Lean / Sigma Improvement Projects

Choosing, setting up, managing, monitoring and reviewing improvement projects

Lean / Sigma Improvement Projects are an essential vehicle and approach to delivering and executing Business improvement projects that help to meet business goals...

Lean Sigma Projects are a great vehicle and provide a structured and robust approach to improving Performance and Results for a business.

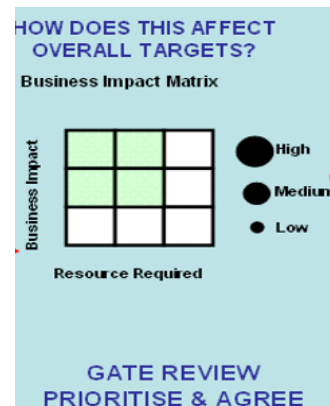

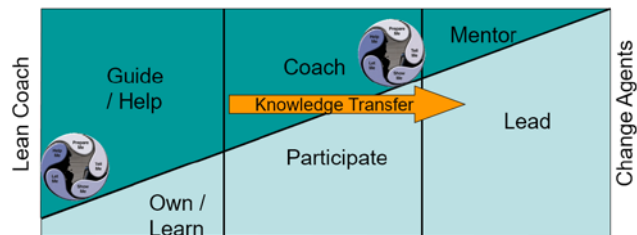

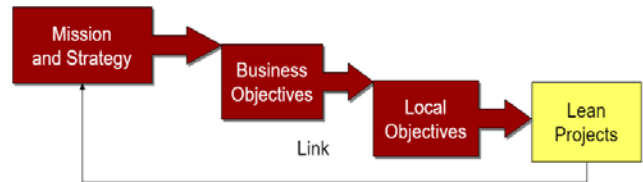

We can help you set up a framework to project manage your process improvement projects using PDCA and DMAIC Frameworks and ensure they align to the strategic purpose and goals of the business. We can also help you to develop the mechanisms to identify the right projects, agree, manage and review them and offer support and guidance with a robust governance framework to help monitor, escalate issues and stay on track.

Having projects with real sponsorship, accountability, ownership, SMART objective, project charters and plans with key milestones help to ensure results are delivered on time and address the right issues to improve performance as well as consider risk.

Another important element of Lean / Sigma Projects is the guidance and support on using the right tools to help with 'deep diving' on problems and identifying waste and variation that maybe causing the gaps in Performance.

We can help review projects, give coaching on the tools and communication methods to senior management on skype, telephone, in person (if required and available) to give you a steer, answer any questions, challenge you and more...

Please visit our website to register your interest or call us to ask any questions you have.
